The outcome of the digestive disintegration of the ingested foodstuffs is, therefore, somewhat different from what one would have assumed only a few years ago. The ultimate sources of energy for the organism start as relatively simple chemical compounds on the path of distribution to the places where they are required for fuel or constructive enterprises. Amino-acids, other nitrogenous units like purins or nucleosides, simple sugars, and fats represent the particular types of matter that enter the transportation routes of the circulation. Sometimes they are built selectively into desired structures--into tissue fabrics or components of secretion; sometimes they are stored in special depots as fat or glycogen or protein to await a future demand for these reserves; sometimes they are at once consumed or, to quote the term used by the physiologist, they are metabolized. The analogies of the steam engine with its fire box and fuel and air supply leave us in the lurch when we attempt to institute a strict comparison with the living organism. Indeed it may as well be admitted that the complete history of the physiological metabolism of matter is still obscure and unrevealed. From time to time, however, new details have come to light, revealing some of the secrets of the chemical processes upon which life depends. Let us turn our attention to a few of these. How Yeast Grows There are organisms which can satisfy their biological needs with a comparatively...
